Trends

Version V10.4 — October 2026

1. What this app does

MEGAVERKS Inventory is a passcode-protected web app that runs from a single web page and stores all data in your own Google Sheet, with photos in your Google Drive. Every change is synced instantly for all users and backed up daily.

- **Inventory** — components with stock in hand, min-stock alerts, photos, multiple products per part, and multiple vendors with per-vendor prices.
- **Orders** — customer purchase orders, grouped by P.O number, searchable, amendable, with partial dispatch tracking.
- **Vendor POs** — professional purchase orders to your suppliers (PDF / WhatsApp / Excel), with GST, terms, delivery dates and amendments.
- **Bills** — vendor invoices with payments, OCR reading, photo filing, and automatic raw-material receipts.
- **Raw Material** — sheet stock (CRCA/MS, GP, HRPO, SS) with receipts, weighment slips, bills and per-kg price trends.
- **RM Usage** — the daily end-of-day entry: sheets used per operation (Punching / Laser / Hand Cutting / Ducting) with customer, P.O and job.
- **Analysis** — consumption, vendor comparison, incoming material and procurement price trends.

2. First-time setup (once, about 5 minutes)

1. Open the app and enter the passcode (default **mega1234**) → Unlock.
2. Go to **Admin** → the backend URL is pre-filled → click **Test Connection** — it should say "Connected".
3. Click **Create/Verify Sheet Tabs** — all 18 tabs are created automatically in your Google Sheet.
4. Click **Run Backend Self-Test** — expect all checks green.
5. Change the passcode in **Admin** → **Change Passcode** so only your team can enter.
6. Click **Set your name** in the top bar — your name is stamped on every change in the audit log.

3. Loading your starting data

1. **Vendors** → **Bulk Upload** — paste your vendor list (name, phone, GSTIN, credit days).
2. **Products** → **Add / Bulk Upload** — your articles (racks, panels, enclosures...).
3. **Inventory** → **Bulk Upload** — components with part number, price and opening stock. Re-uploading updates instead of duplicating.

4. Inventory — components

Each component has company, part number, vendor, price, min stock and opening stock. Stock IN/OUT buttons record movements with date, quantity and note; the In Hand column updates instantly and low/out-of-stock badges appear automatically.

4.1 One component used in multiple products

In Add/Edit Item, tick all products that use the part under **Products Used**. The inventory row shows a badge per product, the product filter finds the part under any of them, and the Products page counts it everywhere.

4.2 Multiple vendors per item (with per-vendor prices)

1. Open the item (🔗 Edit) → find the **Vendor Prices** block.
2. Click ☐ **Add vendor & price**, pick the vendor and enter that vendor's price. Repeat for each supplier.
3. Save — the inventory row shows an "N vendors" badge, View Item lists every vendor with price, and Analysis → Vendor Comparison uses these prices when picking the cheapest source.
4. To amend, edit the price in the row; to remove a vendor, click ✕ on its row, then Save.

5. Orders — customer purchase orders

- **Grouped by P.O number** — one card per P.O with all its articles inside; the search box finds any P.O by number.
- **Amendment** — click 🔄 on a P.O card: change quantities, remove a cancelled customer part (x), add articles, and set the new amended P.O date. Dispatch history stays intact.
- **Dispatch** — click Dispatched, enter per-article quantities, date and invoice number. The card shows Ordered / Dispatched / Balance with a progress bar; component stock is deducted per BOM automatically.

6. Vendor POs — ordering from suppliers

1. **Vendor POs** → ☐ **New Vendor PO** — choose Megaverks or Vengree as the ordering company (letterhead, address and GSTIN are filled automatically), then pick the vendor. Contact person, phone, GSTIN and address autofill from the vendor record and stay editable.
2. Add lines from the inventory list — the rate prefills from your saved price and is editable; quantities and GST % are editable; the totals compute live.
3. Set the **delivery date** and edit the **terms of agreement** if needed.
4. Save — the PO syncs to the sheet. Ordered components appear in **Analysis** → **Incoming material** with ETA, and out-of-stock inventory rows show the ordered quantity and expected delivery.

5. Share it: **PDF** (print-ready letterhead), **WhatsApp** message, or **Excel (.xlsx)** — all include the terms.
6. To amend, open the PO and  — change quantities, lines, rates, GST, delivery date or terms, then Save changes. Cancelled POs stop counting as on-order.

7. Bills — vendor invoices

- **Add Bill** — vendor, invoice no., date, lines, tax (No tax / GST added / GST inclusive), advance paid and credit days; due date is computed automatically.
- **OCR** — pick the invoice photo in the OCR field and press Extract: invoice number, date, GSTIN, phone, address, vendor and grand total are read and pre-filled; unknown vendors are offered for auto-creation.
- **Attachment** — the invoice photo uploads to the Drive "Purchases" folder named VENDOR_DATE.jpg.
- **Payments** — Record Payment moves each bill UNPAID → PARTIAL → PAID automatically.

7.1 Raw material on a bill (sheets + weight in kg)

When a bill is for sheet raw material — e.g. *GI Coil / Sheet 0.80 × 1250 × 2000, 255 Nos, 3,970 kg @ ₹84/kg* — enter it like this:

Field on the bill	Enter in the app
Description of goods	Line description
Quantity in Kgs (3,970)	Qty column = total weight in kg
Rate per Kg (₹84)	Rate column = ₹ per kg
Number of sheets (255 Nos)	Pick the sheet type under the description, then enter Sheets (Nos) = 255

On Save, the 255 sheets are added to Raw Material stock as a receipt interlinked to the bill (same invoice number and vendor), the bill photo doubles as the weighment slip, the sheet's ₹/kg updates, and kg-per-sheet is auto-derived ($\text{kg} \div \text{sheets}$).

8. Raw Material — sheet stock

The **Raw Material** page manages sheet stock. Presets are built in: CRCA/MS (0.8–3 mm), GP With Laminate 120 GSM (2 mm), HRPO (1–3 mm), SS 304/202 (0.6 and 1 mm Single Side Matt, 2 mm 2B finish); sizes 8 ft × 4 ft (2500 × 1250 mm) and 10 ft × 5 ft (3000 × 1500 mm) — every field also accepts custom values.

8.1 Add / edit a sheet type

□ Add Sheet Type → material, thickness, grade, finish, size, kg per sheet, ₹ per kg, min-sheets alert, vendor, notes — and **Sheets In Hand**: enter your opening stock when adding, or correct the count any time when editing. Every correction is logged as an ADJ entry in History (e.g. "Stock correction 40 → 35").

8.2 Receive sheets (IN)

Sheets received, date, ₹/kg, vendor and vendor invoice number (required), plus the **weightment slip photo** — uploaded to Drive and attached to the bill. Saving adds the sheets to stock, auto-creates the vendor bill (kg × ₹/kg) and updates the sheet's ₹/kg.

8.3 Daily usage (OUT)

Sheets used (never more than available), date, customer, P.O/reference (auto-lists that customer's P.O numbers) and job done. Stock subtracts immediately.

8.4 History

Every receipt, usage and correction with slip-viewer links. Entries can be edited (amendment) or deleted — stock totals recalculate automatically.

8.5 Procurement price trends

Per sheet type: a sparkline chart of ₹/kg over time, latest / min / max price, % change since first purchase, and a dated table with vendor, invoice, quantity and ₹/kg — your report of price variations over time.

9. RM Usage — the daily entry page

Open the **RM Usage** page at the end of the day. The form at the top is all your operator needs:

1. **Date** — defaults to today; pick any date if back-entering.
2. **Sheet Type** — the dropdown shows live availability, e.g. "CRCA / MS · 2.5 mm — 20 available".
3. **Operation** — one of **Punching / Laser / Hand Cutting / Ducting**.
4. **Sheets Used** — number of sheets; entering more than available is blocked.
5. **Purpose of usage** — e.g. "Cabinet side panels".
6. **Customer, P.O / Reference** (auto-lists the customer's P.O numbers), **Job done**.

7. **Save Usage** — the sheets subtract from the master list instantly, the toast confirms the new availability, and the entry appears in the log below with date, operation, kg, purpose, customer, P.O and your name.

Entries stay editable (edit icon) and deletable (delete icon) with automatic stock recalculation. The Raw Material master page always shows the current available sheets.

10. Analysis

- Consumption and stock views, low-stock and out-of-stock lists.
- **Incoming material** — open vendor POs: component, ordered qty and expected delivery.
- **Vendor Comparison** — search an item or part number to chart price, lead time and credit period for every supplier (including the per-vendor prices from section 4.2); best value marked ★.
- **Raw material price trends** — ₹/kg variation over time per sheet type.

11. Admin & housekeeping

- **Test Connection / Backend Self-Test** — first stop when anything looks wrong.
- **Dropdown categories** — edit Company, Material Type, Source and Payment Mode lists.
- **OCR engine** — Hugging Face (free token) or a self-hosted custom endpoint.
- **Change Passcode, Audit Log** (who changed what), **Export all data (JSON)**.
- **Backups** — a full copy of the spreadsheet is made automatically every day.

MEGAVERKS Inventory V10.4 — all data lives in your Google Sheet and Google Drive, synced across every user, backed up daily.

12. If something looks wrong

Symptom	Fix
Red toast / cannot save	Admin → Test Connection, then Run Backend Self-Test — the failed line tells you the exact fix.
"Unknown entity" error after an update	The backend Code.gs was not redeployed. Apps Script → paste new Code.gs → Save → Deploy → Manage deployments → edit → New version → Deploy.
Data not showing on another device	Check the "Synced" time in the top bar; a warning icon means the backend did not answer.
Weighment slip / photo not opening	Photos are stored in the MEGAVERKS Drive folders; check Drive permissions.
Wrong stock count	Edit the sheet type and correct Sheets In Hand — the change is logged as an ADJ entry, fully auditable.
